

---

---

THE NORWEGIAN TIT-MOUSE.

---

---

BRUNNICH was the first that ever mentioned this species, which is distinguished by a greenish yellow on the top part of the body ; its breast is spotted with red, and its belly is bluish ; the head is not black as is usual, but the throat is yellow, and towards the vent the feathers are also yellowish ; the tail, which is forked, is of the same colour as the back, with the exception of the last lateral quill feathers, which are white on their exterior side.

---

---

THE TIT-MOUSE OF THE COAST OF MALABAR.

---

---

THIS species of bird is found even in the East Indies ; it lives principally upon caterpillars,
