

a second egg in the first. In another, dissected five days after copulation, he found five empty follicles in the ovaries, and as many eggs in the matrix, to which they adhered. These eggs were about the size of a duck-shot, and the internal membrane was more apparent than in the one he had observed before. In one which he opened six days after copulation there were six empty follicles in one ovaria, and only five eggs in the corresponding horn, and they appeared in one mass; in the other ovaria were four empty follicles and but one egg; these eggs were as big as swan-shot. He opened another on the seventh day after copulation, and found seven empty follicles; he also perceived several internal tumours in the matrix, from whence he took eggs the size of a pistol-bullet. Its membrane was more distinct than before, but contained only a very clear liquor. In one, eight days after copulation, he found in the matrix tumours, or cells, which contained the eggs, but they were very adherent, for he could not loosen them. In another, nine days after copulation, the cells, which contained the eggs, were greatly increased, and he saw that the liquor inclosed by the internal membrane had now got a light cloud floating upon it.

He
