

*Pterosaurs* of several species have been discovered in western Kansas, in the "Middle" Cretaceous, the first by Marsh in 1870; two had an expanse of wings of 20 to 25 feet, and another of 18 feet. They are *toothless*, unlike the foreign species, and are named by Marsh *Pteranodonts*; *anodont* from the

BIRD. — Fig. 1430, *Ichthyornis victor*, skeleton, restored ( $\times \frac{1}{2}$ ); 1431 *a, b, c, d*, *I. dispar*: *a*, left lower jaw, side view ( $\times \frac{1}{2}$ ); *b*, same, top view; *c*, cervical vertebra, side view ( $\times \frac{1}{2}$ ); *d*, same, front view. Marsh.
