

trary, are hollow and permanent like those of the goat. The roe-buck has also no gall-bladder, which is to be found in the gazelle. The gazelles have, in common with the roe-bucks, deep pits under the eyes, and they resemble each other still more in the colour and quality of the hair, in the bunches upon their legs, which only differ in being upon the fore-legs of the gazelle, and upon the hinder legs of the roe-buck. The gazelles, therefore, seem to be intermediate animals between the roe-bucks and goats; but, when we consider that the roe-buck is an animal which is to be found in both continents, and that the goats, on the contrary, as well as the gazelles, belong only to the old world, we shall be induced to conclude that the goats and gazelles are more nearly related to each other, than they are to the roe-buck. The only characters peculiar to the gazelles, are the transversed rings and longitudinal depressions on the horns, the bunches of hair on the fore-legs, the thick streaks of black, brown, or red hair upon the lower part of the sides, and three streaks of whitish hair to the internal surface of the ears.

The second gazelle is an animal found in Senegal, which M. Adanson informs us, is
there
