

the more, but the other parts of their bodies are of a uniform colour, a yellowish brown on the upper and a yellowish grey on the lower. He goes on all fours, and is about a foot and a half long from the muzzle to the insertion of the tail.

The bonnet chinois seems to be a variety of the malbrouck. They differ in the hair on the crown of the head, which in the latter is disposed in the shape of a cap or flat bonnet, and in the tail which is larger. The females of both are subject to a periodical emanation.

THE MANGABEY.*

WE have seen two individuals of this species, both of which were sent to us by the denomination of *Madagascar apes*. They are easily distinguished from all other monkeys by a very apparent character. The mangabey (*fig. 206.*) has its eyelids naked, and of a very striking whiteness. Their muzzle also is large, thick, and long; and they

* This is a precarious name which we have given to this animal, until we know what it is called in its native country. As it is found at Madagascar in the vicinity of *Mangabey*, this name will make it familiar to travellers, who will thus be led to observe it with more precision.
