

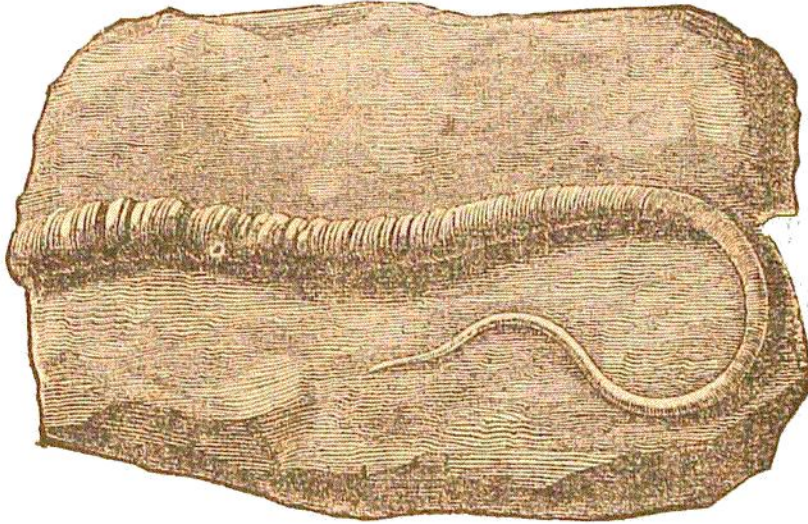

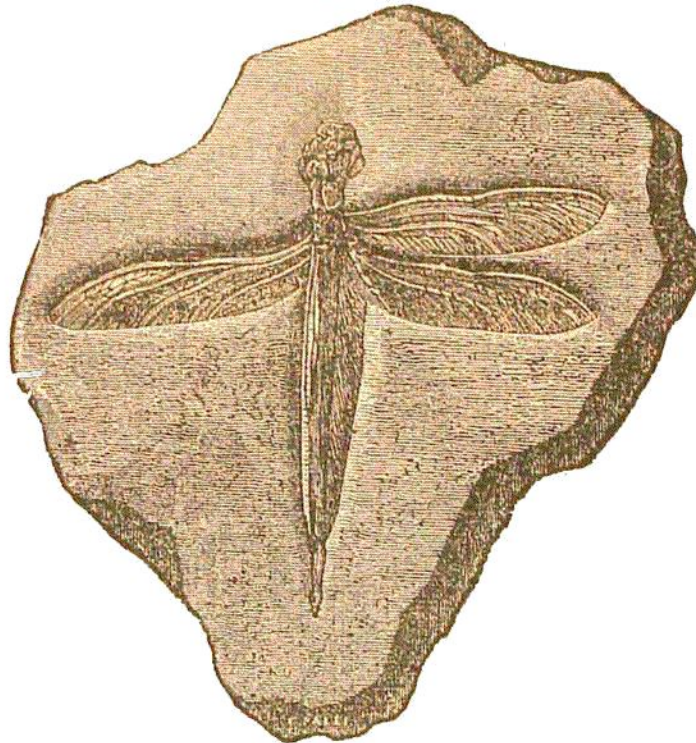

Fig. 286.

*Serpula flagellum.*

of which 847 are coleoptera. Nine species of these insects are found in the carboniferous formation, 120 in the Oolite, two in the chalk, and the rest mostly in the tertiary. Fig. 287, shows a species of *Libellula* from the Oolite.

Fig. 287.

*Libellula.*

In the sandstone of the Connecticut river, in Massachusetts, a fossil occurs, which at first was thought to be a Myriapod, but it seems rather to be the larva of an insect. A view of it greatly enlarged is given in Fig. 288.
