

‘ This explains our pebble ridge. The stones which the glacier rubbed off the cliff beneath it, it carried forwards slowly but surely, till they saw the light again in the face of the ice-cliff, and dropped out of it under the melting of the summer sun, to form a huge dam across the ravine ; till, the “ice-age” past, a more genial climate succeeded, and neve and glacier melted away ; but the “moraine” of stones did not, and remain to this day, the dam which keeps up the waters of the lake.

‘ There is my explanation. If you can find a better, do ; but remember always that it must include an answer to,—
How did the stones get across the lake ?’
