

Iceland, in 1844. The bones occur in great numbers, on the shores of Iceland, Greenland, and Denmark, showing that it was once a common bird; and its remains have been found also on the coasts of Labrador, Maine, and eastern Massachusetts. They occur in the shell-heaps of Maine, Wyman having found seven specimens of the humerus, besides other bones. With these are bones of other species, but of none that are extinct, and also fragments of rude pottery, and some bone-implements.

Dodo, with the Solitaire in the background and an extinct Night Heron to the right.

A species of Manatee, *Rytina Stelleri* Cuv., known in the last century on the Arctic shores of Siberia, is supposed to be now extinct.

The Aurochs (*Bison priscus*) of Europe, one of the cotemporaries of the old Elephant (*Elephas primigenius*), would have long since been exterminated from Europe, but for the protection of Man. Though once abundant, it is now confined on that continent
