The reader will not fail to remark, that among these constituent principles of the blood, gelatine is not mentioned. In fact, though existing most abundantly in various animal structures, gelatine is never found in the blood, or in any product of glandular secretion. We formerly noticed that in the scale of organized substances, gelatine appears to rank lower than albumen: and we may now add, that a given weight of gelatine, contains at least three or four per cent. less carbon, than an equal weight of albumen. The production of gelatine from albumen must, therefore, be a reducing process. We shall presently have occasion to revert to these facts. In the mean time we subjoin the few observations we have to offer, on the organization or structure of the blood.

^{*} Le Canu; mean of two analyses.
